

**In the claims:**

**Claim 1** (currently amended)      A roller screw drive having a spindle nut (2) arranged on a threaded spindle (1), and having rollers (3) which are arranged such that they can roll in a thread path (4), the thread path (4) being delimited by thread grooves (8a, 11, 20) provided on the threaded spindle (1) and on the spindle nut (2), which thread grooves are each delimited by two thread flanks, the rollers rolling on thread flanks, which face one another, of the two thread grooves, wherein the two equal pitches (p) of the thread grooves (8a, 11, 20) are arranged so as to be axially offset with respect to one another by a partial amount (a) of the pitch (p) thread flanks are longer than the rollers, a free space being formed between end sides of the rollers and thread flanks situated opposite said end sides, and wherein a first roller set formed from rollers is arranged such that it can roll in a first thread path, and a second roller set is arranged such that it can roll in a second thread path and wherein the rotational axes of the rollers of the first roller set are arranged at an angle to the rotational axes of the rollers of the second roller set and wherein the rollers of the first roller set are arranged such that they can roll on one thread flank of the thread groove of the threaded spindle, and the rollers of the second roller set are arranged such that they can roll on the other thread flank of the thread groove of the threaded spindle.

Cancel Claim 2.

**Claim 3 (currently amended)** The roller screw drive of claim 2 1, ~~in which~~  
wherein the free space (26, 27) is formed as a lubricant reservoir.

**Claim 4 (currently amended)** The roller screw drive of claim 1, ~~in which~~  
wherein a cage (15, 18) is provided for guiding the rollers, ~~rollers (3)~~ being held in the  
pockets (16, 25) of said cage (15, 18), the cage (15, 18) having belts (17, 19) having webs  
connecting them to one another, the belts (17, 19) being arranged in the free space (26,  
27).

**Claim 5 (currently amended)** The roller screw drive of claim 4, ~~in which~~  
wherein the belts (17, 19), which are arranged at a distance from one another, span one  
plane, the rotational axes of the rollers (3) being arranged parallel to the plane and  
transversely with respect to the belts (17, 19).

**Claim 6 (currently amended)** The roller screw drive of claim 4, ~~in which~~  
wherein the webs and the free space (26, 27) loop around the rotational axis of the roller  
screw drive in the manner of a screw.

Cancel Claims 7 to 9.

**Claim 10 (currently amended)** The roller screw drive of claim 9 1, ~~in which~~  
wherein the spindle nut (2) has two first and second nut parts (7, 8) arranged one behind

the other axially, the first roller set being arranged in the first nut part (7) and the second roller set being arranged in the second nut part (8).

**Claim 11 (currently amended)** The roller screw drive of claim 10, ~~in which~~ wherein a spacer (24) is provided which keeps the two nut parts (7, 8) at an axial distance from one another and defines an axial distance dimension which is such that the nut parts (7, 8) are kept in a prestressed state with the threaded spindle (1).

**Claim 12 (currently amended)** The roller screw drive of claim 1, ~~in which~~ wherein the two thread flanks (9, 10, 12, 13, 21, 22) of the thread groove (8a, 11, 20) are perpendicular to one another, the partial amount (a) corresponding to approximately 30%, ~~preferably 28%~~, of the absolute value of the pitch (p).
